

SHOWCASE

Crypto and P2P Support Case Studies

Realistic crypto exchange and P2P support cases showing how to investigate transaction issues, collect evidence, communicate with users, document findings, and escalate sensitive cases to the correct team.

Crypto support

P2P dispute handling

Transaction investigation

Fraud-aware thinking

Risk escalation

Payment verification

CASE STUDY 1

Buyer Marked Paid But Seller Did Not Receive Funds

Scenario

A P2P seller reports that the buyer clicked "I have paid," but the seller has not received the money in their bank account.

Risk

The buyer may have made a false payment claim, payment may be delayed by the bank, or the seller may not have checked the correct account.

Escalation

Escalate to P2P dispute/risk team if payment proof and bank evidence do not match.

SUPPORT PROCESS

1. Advise the seller not to release crypto until payment is confirmed.
2. Ask for the order number.
3. Request seller's bank statement screenshot for the transaction period.
4. Request buyer's payment proof.
5. Compare payment name, amount, timestamp, and reference number.
6. Check if payment was sent from a third-party account.
7. Keep both users neutral and avoid blaming either side.
8. Escalate if evidence is unclear or suspicious.

CUSTOMER RESPONSE

Hi [Customer Name],

Thank you for reporting this. Please do not release the crypto until the payment is confirmed in your bank account.

To help review this case, please send a screenshot of your bank transaction history for the relevant time period and the order number. We will review the evidence from both sides and take action based on the confirmed payment status.

Best,
Surafel

Internal note

Seller reports buyer marked payment as completed, but funds are not visible in seller's bank account. Seller advised not to release crypto. Requested bank evidence and order details. Buyer payment proof should be reviewed.

Learning

In P2P support, the agent must remain neutral, evidence-based, and careful. The most important rule is to protect funds while avoiding unfair judgment before review.

CASE STUDY 2

Deposit Confirmed On-Chain But Not Credited

Scenario

A user sends crypto to the correct deposit address. The transaction shows confirmed on the blockchain, but the balance is not updated in the user's account.

Escalation

Wallet/technical team.

SUPPORT PROCESS

1. Ask for TXID, network, amount, and deposit address.
2. Check the transaction on a blockchain explorer.
3. Confirm whether the required number of confirmations has been reached.
4. Check if the deposit address matches the user's account.
5. Check internal deposit status if admin tools are available.
6. Escalate to wallet/technical team if on-chain confirmation is complete but credit is missing.

CUSTOMER RESPONSE

Hi [Customer Name],

I understand your concern. I checked that this type of issue needs to be reviewed using the transaction details.

Please send the TXID, network used, deposit address, amount, and transaction time. If the transaction is already confirmed on the blockchain but not credited to your account, we can escalate it to the wallet team for further review.

Best,
Surafel

Internal note

User reports confirmed crypto deposit not credited. Need TXID and network details. If confirmed on-chain and address is correct, escalate to wallet team.

Learning

Never confirm missing deposit status without checking the TXID, network, and deposit address. Blockchain confirmation and internal credit status are separate checks.

CASE STUDY 3

Wrong Network Deposit

Scenario

A user deposits USDT using BEP20 instead of ERC20, or another unsupported/wrong network.

Escalation

Wallet/technical team after complete transaction details.

SUPPORT PROCESS

1. Ask for TXID, network used, intended network, deposit address, and amount.
2. Confirm whether the receiving platform supports the network.
3. Check whether the deposit address belongs to the platform.
4. Explain that recovery may not be guaranteed.
5. Escalate to wallet team only after collecting complete details.

CUSTOMER RESPONSE

Hi [Customer Name],

I'm sorry this happened. Sending crypto through the wrong network can be stressful, and I'll help you submit the case for review.

Please send the TXID, network used, intended network, deposit address, amount, and transaction time. Once we have these details, the wallet team can check whether recovery is technically possible. Please note that recovery is not always guaranteed.

Best,
Surafel

Internal note

Possible wrong-network deposit. Full transaction details requested. Needs wallet team review.
Recovery not guaranteed.

Learning

The agent must be empathetic but should not promise recovery before technical review.

CASE STUDY 4

Withdrawal Delayed Due to Security Review

Scenario

A user's withdrawal is pending longer than expected. The user is frustrated and wants a specific release time.

Escalation

Escalate if the security review exceeds normal limits or status requires manual follow-up.

SUPPORT PROCESS

1. Check withdrawal status.
2. Check account verification status.
3. Check whether the transaction is pending internal review.
4. Check if there are security/risk flags.
5. Explain the situation without exposing sensitive security logic.
6. Escalate if review time exceeds normal limits.

CUSTOMER RESPONSE

Hi [Customer Name],

I understand that waiting for a withdrawal can be frustrating. I checked that some withdrawals may require additional review for account and transaction security.

At this stage, please make sure your account verification is complete and that there are no pending security requests on your account. I will monitor the status and escalate the case if the review takes longer than expected.

Best,
Surafel

Internal note

User reports delayed withdrawal. Possible security or manual review. Avoided exposing internal risk rules. Monitor and escalate if delay exceeds expected timeframe.

Learning

Security-related support requires careful communication. The agent should reassure the user without revealing risk rules or making false promises.

CASE STUDY 5

Suspicious P2P Pattern

Scenario

A user has multiple P2P disputes in a short period, often with similar claims and unclear payment proof.

Escalation

Fraud/risk team.

SUPPORT PROCESS

1. Review recent dispute history.
2. Check repeated behavior patterns.
3. Compare order amounts, counterparties, timestamps, and evidence.
4. Document objective facts.
5. Avoid accusing the user directly.
6. Escalate to fraud/risk team.

CUSTOMER RESPONSE

Hi [Customer Name],

Thank you for contacting us. We are reviewing the order details and payment evidence carefully.

To continue the review, please provide the payment receipt, bank reference number, and any communication related to the transaction. Once the evidence is reviewed, we will update you with the next step.

Best,
Surafel

Internal note

User has repeated P2P disputes with similar payment claims. Evidence appears incomplete.
Recommend risk/fraud review before further action.

Learning

Fraud-aware support depends on documentation, patterns, and escalation. The support agent should not accuse the user but should preserve evidence clearly.
