EXAMPLE 1

Web Dashboard Not Loading

Issue

User logs in successfully, but dashboard keeps loading and account data does not appear.

User impact

User cannot access account data or complete tasks.

Initial questions

- Which browser are you using?
- Does it happen in incognito/private mode?
- Does it happen on another device?
- When did the issue start?
- Can you send a screenshot or screen recording?

Possible root causes

- Browser cache issue
- Frontend loading error
- API response failure
- Account-specific data issue
- Temporary service outage

CUSTOMER RESPONSE

Hi [Customer Name],

Thank you for reporting this. I'm sorry the dashboard is not loading properly.

Please try opening the dashboard in a private/incognito window and clearing

your browser cache. Also, could you send a screenshot or short screen recording, along with your browser name and device type?

If the issue continues after these checks, I'll document the details and escalate it to the technical team.

Best,
Surafel

Engineering note

User can log in but dashboard data does not load. Requested browser/device details and screenshot. Possible frontend/API issue. Needs review if reproducible after cache/incognito test.

EXAMPLE 2

API Integration Error

Issue

User's third-party integration fails with an authentication error.

Escalation

Escalate to API/backend team if key permissions are correct but authentication still fails.

Initial questions

- Was the API key recently changed?
- What exact error message appears?
- Which endpoint is failing?
- What was the request timestamp?
- Is IP whitelisting enabled?

Possible root causes

- API key status
- Permission level
- IP whitelist
- Recent key rotation
- Error code
- Request timestamp mismatch

CUSTOMER RESPONSE

Hi [Customer Name],

I can help check this integration issue.

Please confirm whether the API key was recently changed and send the exact

error message you are receiving. Also, if possible, please share the request timestamp and the endpoint you are trying to access.

For security, please do not send your full API secret. If needed, only share the last few characters of the API key for identification.

Best,
Surafel

Engineering note

User reports API authentication error. Need endpoint, error code, timestamp, and API key status.
Reminded user not to share full API secret.

EXAMPLE 3

Mobile App Upload Issue

Issue

User cannot upload image/video from mobile app.

Possible root causes

- App permission issue
- File size too large
- Unsupported file format
- App cache issue
- OS file picker issue
- Network interruption

CUSTOMER RESPONSE

Hi [Customer Name],

I'm sorry you're having trouble uploading the file.

Please check the following:

1. Confirm the app has permission to access photos/files.
2. Try uploading a smaller file.
3. Make sure the file type is supported.
4. Restart the app and try again.
5. If possible, test using another network.

If the issue continues, please send your phone model, app version, file type, file size, and a screenshot of where the upload fails.

Best,
Surafel

Engineering note

Mobile upload issue reported. Need device model, OS version, app version, file type, file size, and failure point. Possible permission or file picker issue.

EXAMPLE 4

Payment Webhook Delay

Issue

User paid successfully, but account subscription was not activated.

Escalation

Billing/backend team.

Possible root causes

- Webhook delay
- Payment provider timeout
- Failed callback
- Duplicate payment record
- Billing sync issue

CUSTOMER RESPONSE

Hi [Customer Name],

Thank you for sharing this. I understand that you completed the payment but your account has not been updated yet.

Please send your payment receipt or transaction reference, payment time, and the email linked to your account. Once we verify the payment, we can check why the account status did not update correctly.

Best,
Surafel

Engineering note

Payment completed but subscription not activated. Possible webhook or billing sync delay. Need billing/payment provider verification.

EXAMPLE 5

Integration Not Syncing Data

Issue

User connected third-party integration, but data is not syncing.

Support process

1. Confirm integration connection status.
2. Check permissions.
3. Ask when the last successful sync happened.
4. Check for error messages.
5. Ask whether the user recently changed credentials.
6. Escalate if permissions are correct but sync still fails.

CUSTOMER RESPONSE

Hi [Customer Name],

I can help check why the integration is not syncing.

Please confirm when the last successful sync happened and whether you recently changed your login details, API key, or permissions. Also, please send any error message you see on the integration page.

Once I have those details, I can help narrow down whether this is a permission issue, connection issue, or something that needs technical escalation.

Best,
Surafel

Engineering note

Integration sync issue reported. Need last successful sync time, credential changes, permissions, and error message before escalation.
